

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method for managing traffic in a network, involving a communication device with a limited power supply, comprising: characterized by:

determining a current level of available power in said power supply for transmitting and receiving functions of said communication device;

communicating said power level to a controller;

determining a current power drain rate of said power supply source;

detecting a need for data transfer associated with said communication device, wherein said data transfer is ~~one-of~~ an incoming call to said communication device or and-a request for transmission from said communication device;

determining a quantity of data relating to said data transfer;

calculating whether said power level is sufficient to effect the transfer of said quantity of data; ~~and-signaling-said-controller-to-effect-said-data-transfer-according-to~~ said power level calculations, wherein a quality of service level provided to the communication device in the network is changed in response to said power level calculations; and

wherein if said power level and said power drain rate is sufficient to transfer said quantity of data, said controller includes: commencing the transfer of said quantity of data to the communication device, wherein

if said power level and said power drain rate is not sufficient, transferring a portion of said quantity of data to the communication device and transferring the remainder of said quantity of data to a predetermined destination.

~~instructions-based-on-said-power-supply-connections-for-one-of-receiving all-of-said-data-or-receiving-a-partion-of-said-data;~~

~~means-for-redirecting-all-of-said-data-to-a-predetermined-location; and~~

~~means for receiving the portion of said data and directing the remainder of said data to a predetermined address.~~

2. (Original) The method of Claim 1, further characterized by:

storing initial parameters for said power supply of said communication device and periodically updating said power supply parameters, wherein said parameters include:

a drain rate for each communication service available to said communication device; and an initial power source level upon connection to the network.

3. (Canceled)

4. (Original) The method of Claim 1, wherein said communication device is a battery operated remote sensor and said network is a wireless network.

5. (Original) The method of Claim 4, wherein said network is a non-wireless network.

6. (Original) The method of Claim 1, wherein said communication device is a wireless mobile terminal and said network is a wireless network.

7. (Original) The method of Claim 6, wherein said traffic is voice traffic and a voice call is begun on said mobile terminal at a first quality of service level according to an initially determined power level and power drain rate of said mobile terminal battery, and said voice call is continued at a second quality of service level according to a subsequently determined power level and power drain rate of said mobile terminal battery.

8. (Currently Amended) The method of Claim 6, wherein a video message is presented for transfer and the audio portion of the message is transferred but the video portion is redirected to a predetermined address and a message is sent to inform a the-recipient of said audio the location of said video portion.

9. (Original) The method of Claim 3, wherein said data comprises a Multimedia Messaging Service (MMS) message.

10. (Original) The method of Claim 3, wherein said data comprises a video message.

11. (Original) The method of Claim 1, wherein said communication device is a wireless modem.

12. (Original) The method of Claim 1, wherein said communication device is a cordless phone system and said network is a public switched telephone network (PSTN).

13. (Original) The method of Claim 1, wherein said communication device is a personal digital assistant and connects to a PSTN by wirelessly connecting to a computer connected to said PSTN

14. (Previously Presented) An apparatus for managing traffic in a network involving a communication device with a limited power supply, the apparatus comprising characterized by:

a transceiver for receiving and transmitting data messages;

a controller for monitoring a current power level of said power supply and a calculated power drain rate of said communication device, wherein said controller includes means for:

receiving all of said data messages;

redirecting all of said data messages to a predetermined location; and
based on the current power level, receiving a portion of said data messages and directing the remainder of said data messages to a predetermined address based on the power level; and
means coupled to said power supply for determining said power drain rate of said communication device;

signal means for signaling said communication device to ~~one~~ receive or and transmit data messages according to said current power level and said power drain rate, wherein a quality of service level provided to the communication device in the network is changed in response to said power level calculations, [f.] wherein

if said current power level and said power drain rate are sufficient to transfer said quantity of data, said controller commencing the transfer of said quantity of data and if said current power level and said power drain rate are not sufficient, said controller transferring a portion of said quantity of data to the communication device and transferring the remainder of said quantity of data to a predetermined destination.

15. (Original) The apparatus of Claim 14, further characterized by:

a database for storing initial parameters for said power supply of said communication device and periodically updating said power supply parameters, wherein said parameters include:

a drain rate for each communication service available to said communication device; and

an initial power source level upon connection to the network.

16. (Canceled)

17. (Original) The apparatus of Claim 14, wherein said communication device is a battery operated remote sensor and said network is a wireless network.

18. (Original) The apparatus of Claim 17, wherein said network is a non-wireless network.

19. (Original) The apparatus of Claim 14, wherein said communication device is a wireless mobile terminal and said network is a wireless network.

20. (Original) The apparatus of Claim 19, wherein said traffic is voice traffic and a voice call is begun by said wireless mobile terminal at a first quality of service level according to an initially determined power level and power drain rate of a battery for said wireless terminal and said voice call is continued at a second quality of service level according to a subsequently determined power level and power drain rate of said battery.

21. (Currently Amended) The apparatus of Claim 14, wherein a video message is presented for transfer and the audio portion of the message is transferred but the video portion is redirected to a predetermined address and a message is sent to inform a the recipient of said audio the location of said video portion.

22. (Original) The apparatus of Claim 14 wherein said communication device is a wireless modem.

23. (Original) The apparatus of Claim 14, wherein said communication device is a cordless phone system and said network is a public switched telephone network (PSTN).

24. (Original) The apparatus of Claim 14, wherein said communication device is a personal digital assistant and connects to a PSTN by wirelessly connecting to a computer connected to said PSTN.

25. (Original) The apparatus of Claim 14, wherein said means for determining said power drain rate further comprises periodically determining said power drain rate associated with said communication device when said communication device changes location during data transmission.

26. (Original) The method of Claim 1, wherein the step of determining a current power drain rate of said power source further comprises the step of periodically determining said drain rate when said communication device changes location during data transmission.
